- 1. A method of simulating and optimizing qualification testing of lubricating oil products, the method comprising:
 - a. passing a plurality of lubricating oil product characteristics to a simulator engine, wherein the simulator engine comprises a plurality of simulated qualification tests and processing the lubricating oil product characteristics in one or more of the simulated qualification tests, wherein the output of each simulated qualification test includes a probability of passing indicator for indicating the probability that a lubricating oil product have the inputted characteristics would pass an actual qualification test;
 - b. passing an input of the plurality of lubricating oil product characteristics, the probability of passing indicator from each simulated qualification test, and a proposed test sequence of a plurality of qualification tests to a strategy simulator engine and processing the input to determine a probability of passing indicator, cost and time duration of the proposed test sequence.

2. The method of claim 1, further comprising passing as a second input the plurality of lubricating oil product characteristics, the proposed test sequence and the probability of passing indicator from each simulated qualification test to an strategy optimizer engine and processing the second input to determine an optimum test sequence, based on predetermined criteria, for performing actual qualification tests.

3. The method of claim 2, wherein the strategy optimizer engine utilizes 1 optimizing techniques selected from genetic algorithms, simulated 2 3 annealing, and mixtures thereof. 4 4. The method of claim 2, wherein the pre-determined criteria comprise 5 test sequence cost and test sequence time duration. 6 7 5. The method of claim 2, wherein the simulator engine is configured to 8 9 account for a random factor for each simulated qualification test. 10 11 6. The method of claim 1, wherein the simulated qualification tests are modeled using as a third input data from actual qualification tests with 12 modeling techniques selected from neural networks, Bayesian network, 13 14 and mixtures thereof. 15 7. The method of claim 6, wherein the third input further comprises data 16 from expert knowledge and wherein the modeling technique is the 17 18 Bayesian network modeling technique. 19 20 8. The method of claim 1, wherein the lubricating oil product 21 characteristics comprise base oil percentage and characteristics, viscosity index improver percentage and characteristics, additives 22 23 percentage and characteristics, and pour point depressants percentage 24 and characteristics. 25 9. The method of claim 1, wherein the strategy simulator engine utilizes 26 27 Monte Carlo statistical techniques. 28 10. The method of claim 9, wherein the strategy simulator engine is 29

qualification tests of the test sequence.

30 31 configured to operate in series or in parallel on the individual simulated

1 11. The method of claim 1, wherein the strategy simulator engine is 2 configured to change the characteristics of the lubricating oil product 3 under test in a manner consistent with a pre-determined Codes of 4 Practice for lubricant oil testing where the initial characteristics would 5 not result in the lubricating oil product passing all qualification tests. 6 7 12. The method of claim 10, wherein the pre-determined Codes of Practice 8 comprise permissible mid-test sequence changes of the characteristics 9 of the lubricating oil product under test and permissible multi-grade 10 tests. 11 12 13. The method of claim 9, wherein the strategy simulator engine is 13 configured to produce an output for a plurality of variations of 14 lubricating oil product characteristics. 15 16 14. The method of claim 8, wherein Codes of Practice are entered into the 17 strategy simulator engine via a Rules Engine. 18 19 15. The method of claim 9, wherein the Rules Engine is configured and 20 adapted to accept Rules of Practice input via a plain-English interface, 21 and wherein the Rules Engine processes the input into a computer 22 programming language format which provides instructions which the 23 strategy simulator engine can read and follow. 24 25 16. A system for simulating and optimizing qualification testing of 26 lubricating oil products, the system comprising: 27 a. a CPU; 28 b. a memory operatively connected to the CPU, the memory 29 containing a program adapted to be executed by the CPU and

qualification testing of lubricating oil products;

the CPU and memory cooperatively adapted for simulating

30

31

- c. a simulator engine code segment embodied on a computer-readable medium configured and adapted for receiving as input a plurality of lubricating oil product characteristics, wherein the simulator engine comprises a plurality of simulated qualification test code segments, and configured and adapted for processing the input of lubricating oil product characteristics in one or more of the simulated qualification test code segments, wherein the output of each simulated qualification test code segments includes a probability of passing indicator for indicating the probability that a lubricating oil product have the inputted characteristics would pass an actual qualification test;
- d. a strategy simulator code segment embodied on a computer-readable medium configured and adapted for receiving as a second input the plurality of lubricating oil product characteristics, the probability of passing indicator from each simulated qualification test code segment, the plurality of lubricating oil product characteristics, and a proposed test sequence of a plurality of qualification tests, and processing the second input to determine a probability of passing indicator, cost and time duration of the proposed test sequence.

17. The system of claim 16, further comprising a strategy optimizer engine code segment embodied on a computer-readable medium configured and adapted for receiving as a third input an initial test sequence, the plurality of lubricating oil product characteristics, and the probability of passing indicator from each simulated qualification test, and processing the third input to determine an optimum test sequence, based on predetermined criteria, for performing actual qualification tests.

18. The system of claim 17, wherein the strategy optimizer engine code 1 2 segment utilizes optimizing techniques selected from genetic 3 algorithms, simulated annealing, and mixtures thereof. 4 19. The system of claim 17, wherein the pre-determined criteria comprise 5 test sequence cost and test sequence time duration. 6 7 8 20. The system of claim 17, wherein the strategy optimizer engine code 9 segment is configured and adapted to account for a random factor for 10 each simulated qualification test. 11 12 21. The system of claim 16, wherein the simulated qualification test code 13 segments are constructed from a fourth input of data from a database of actual qualification tests with modeling techniques selected from 14 neural networks, Bayesian network, and mixtures thereof. 15 16 22. The system of claim 21, wherein the fourth input further comprises data 17 18 from a database of expert knowledge and wherein the modeling 19 technique is the Bayesian network modeling technique. 20 21 23. The system of claim 16, wherein the input of lubricating oil product 22 characteristics comprises base oil percentage and characteristics, viscosity index improver percentage and characteristics, additives 23 24 percentage and characteristics, and pour point depressants percentage 25 and characteristics. 26 27 24. The system of claim 16, wherein the strategy simulator engine code segment is constructed from Monte Carlo statistical techniques. 28

25. The system of claim 24, wherein the strategy simulator engine code segment is configured and adapted to process in series or in parallel the input of individual simulated qualification tests of the test sequence.

- 26. The system of claim 16, wherein the strategy simulator engine code segment is configured and adapted to change the characteristics of the lubricating oil product under test in a manner consistent with a predetermined Codes of Practice for lubricant oil testing where the initial characteristics would not result in the lubricating oil product passing all qualification tests.
 - 27. The system of claim 26, wherein the pre-determined Codes of Practice comprise permissible mid-test sequence changes of the characteristics of the lubricating oil product under test and permissible multi-grade tests.
 - 28. The system of claim 26, wherein the strategy simulator engine code segment is configured and adapted to produce an output of a plurality of variations of lubricating oil product characteristics.
 - 29. The system of claim 26, further comprising a Rules Engine code segment for incorporating the Codes of Practice into the strategy simulator engine.
 - 30. The system of claim 26, wherein the Rules Engine code segment is configured and adapted to accept Codes of Practice input via a plain-English interface, and wherein the Rules Engine code segment translates the input into a computer programming language code segment configured and adapted provides instructions which the strategy simulator engine segment can read and follow.
